DESIGN REMARKS

Our proposal takes advantage of masonry brick's modular qualities and uses it both structurally and decoratively in the facade. The large structural columns up front support the weight of the roof and second floor while the more delicate in-set screen wall lets light filter through and creates a 3 dimensional pattern that the user can interact with. Other masonry elements include the hollow core slabs and the UHPC panels which provide horizontal clarity. These panels contrast the texture of the brick and give an element of artistic freedom to the facade, as they can be cast into a wide range of more delicate shapes or solid planes.
