The Problem

Bearing the ultimate responsibility for the wellness and safety of 20-30 (or more!) children can produce overwhelming amounts of occupational stress. That’s what child care workers like the daycare instructors, elementary school teachers, and camp counselors we spoke to reported experiencing on a daily basis. High levels of stress manifest themselves in both mental and physical ways, keep these caretakers from performing at their best, which in turn, puts your children at risk too. So how can we make their lives just a little bit easier, and help them spend less energy worrying about feelings of uncertainty or a lack of control?

Our Solution

SuperViZE is a group monitoring system that’s been optimized for the caretakers of larger groups of children that triangulates their relative locations for chaperones to view at any time and conduct automated roll calls. Existing child tracking devices are too slow, complex to use, or only effective for 2 to 3 children, so we’ve designed our device to not only be simple to use and quick to setup, but it also utilizes a standard electromagnetic lock that’s so secure, even an adult would have difficulty removing it. If little Lucy wanders out of safe range, Lucy and her chaperone’s devices will beep to alert them. Now that you can efficiently monitor all your children at once, you can waste less time stressing out and put more focus on doing your job well, effectively lowering risk and improving the quality of your care. Finally... some peace of mind!
